I/O Configuration Using z/OS HCD and HCM Sep 11 2020 IBM® System z® servers offer a full range of connectivity options for attaching peripheral or internal devices for input and output to the server. At the other end of these connections are a variety of devices for data storage, printing, terminal I/O, and network routing. This combination of connectivity and hardware offer System z customers solutions to meet most connectivity requirements. However, to make use of these features, the System z server must be

properly configured. This IBM Redbooks® publication takes a high-level look at the tools and processes involved in configuring a System z server. We provide an introduction to the System z channel subsystem and the terminology frequently used in the hardware definition process. We examine the features and functions of tools used in the hardware definition process, such as HCD, CHPID Mapping Tool, and HCM. We discuss the input and output of these tools (IODF, IOCP, IOCDS) and their relationship to one another. We also provide a high-level overview of the hardware configuration process (the flow of generating a valid I/O configuration). We provide configuration examples using both HCD and HCM. The book also discusses available new functions and guidelines for the effective use of HCD and HCM. This document is intended for system programmers and administrators who are responsible for defining and activating hardware changes to z/OS® and System z servers, and for the IBM representatives who need this information. General knowledge of z/OS and IOCP is assumed.

Energy Systems: Control
Engineering Design* offers a
novel take on advanced control
engineering design techniques
for wind turbine applications.
The book introduces
concurrent quantitative
engineering techniques for the
design of highly efficient and
reliable controllers, which can
be used to solve the most
critical problems of multi-
megawatt wind energy
systems. This book is based on
the authors' experience during
the last two decades designing
commercial multi-megawatt
wind turbines and control
systems for industry leaders,
including NASA and the
European Space Agency. This
work is their response to the
urgent need for a truly reliable
concurrent engineering
methodology for the design of
advanced control systems.
Outlining a roadmap for such a
coordinated architecture, the
authors consider the links
between all aspects of a multi-
megawatt wind energy project,
in which the wind turbine and
the control system must be
cooperatively designed to
achieve an optimized, reliable,
and successful system. Look

variable electrical grid and work automatically under very turbulent and unpredictable environmental conditions. The book covers topics including robust QFT control, aerodynamics, mechanical and electrical dynamic modeling, economics, reliability, and efficiency. It also addresses standards, certification, implementation, grid integration, and power quality, as well as environmental and maintenance issues. To reinforce understanding, the authors present real examples of experimentation with commercial multi-megawatt direct-drive wind turbines, as well as on-shore, offshore, floating, and airborne wind turbine applications. They also offer a unique in-depth exploration of the quantitative feedback theory (QFT)—a proven, successful robust control technique for real-world applications—as well as advanced switching control techniques that help engineers exceed classical linear limitations.
